

EASY RELEASE

Speed system separation link

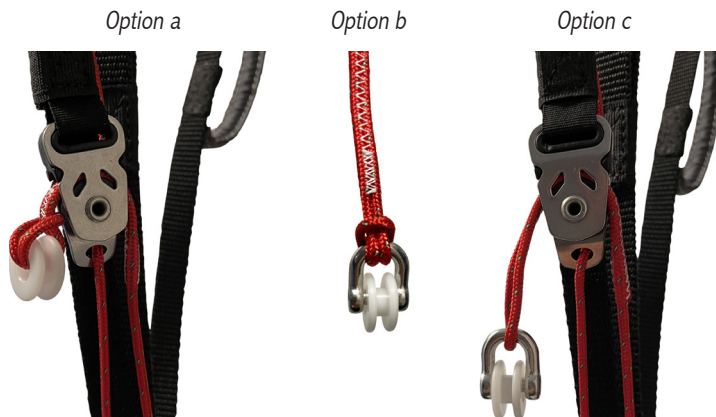

The EASY RELEASE is used to automatically disconnect the speed system when using separation carabiners. The system convinces by low construction height, weight neutrality compared to a standard Brummel hook connection and durable, safe function.

Lieferumfang

- 2x Ring clip
 - 2x Shackle
 - 2x Release hook with speed system line (white) and release line (yellow) for attachment to the harness
- 

Installation

1. Unloop the Brummel hook from the speed system line of the riser (see the red line in the picture on the right).
2. Connect the ring clip to the speed system line of the riser. There are three ways to do this:
 - a. Loop the ring clip into the speed system line of the riser (if the line is not too thick)
 - b. Fit the ring clip into the shackle and then loop the shackle into the speed system line of the riser
 - c. Pass the shackle through the loop of the speed system line of the riser and then fit the ring clip into the shackle

3. Attach the release line to the harness by looping it through. Then lay out and adjust the white speed system line according to the operating instructions provided by the harness manufacturer. You may also be able to loop the existing speed system line of the harness into the release hook instead of using the line supplied.
4. Clip the release hook into the ring clip. The release system is now ready for use. When activated, the release line turns the hook in the direction of the released riser's pull and automatically separates the hook from the clip.

Release
